WPI; 2002-750636/81.

Antiallergic compositions containing an anti-histamine, a histamine synthesis inhibitor, and optionally an allergen or nucleic acid coding for the allergen.

Claim 14; Page 11; 32pp; French.

The invention relates to antiallergic compositions containing an anti-histamine, a histamine synthesis inhibitor, and optionally an allergen or isolated mucleic acid molecule that has at least one polymolectide sequence coding for the allergen, together with a pharmaceutical carrier. The pharmaceutical composition of the invention is useful as a non-specific antiallergic treatment, and also useful in the treatment of allergic hypersensitivity, allergic asthma, allergic rhinitis, and allergic and atopical eczema. This sequence represents a peptide of a cysteine protease epitope region relating to the antiallergic

The peptide is one of a series of overlapping peptides synthsised by standard techniques to cover the whole Dermatopagoides preronyssinus Der pi sequence. The T cell epitopes of the protein were mapped by detection of the peptides ability to stimulate T cell activity. The peptides may be used for diagnosis and treatment of sensitivity to house dust mite allergens. When administered to house dust mite sensitivity in publicity the peptides may the peptides are capable of modifying the allergic response to the allergens. The peptides may be modified for e.g. increasing solublity, enhancing therapeutic or preventive efficacy or stability. See also AAR349466-700 and AAR36398-490. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Isolated peptide(s) of dermatophagoides protein allergens - for diagnosis and treatment of sensitivity to house dust mite.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             T cell epitope; house dust mite; allergy; soluble; Def pI.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to an antiallergic pharmaceutical composition (1) comprising a pharmaceutical carrier containing an active agent combination of at least two off an allergen; an antihistamine; and a histamine synthesis inhibitor. (1) is used for treating or preventing allergic hypersensitivity reactions, especially allergic asthma, allergic hypersens trivity reactions, in babies, children or adults. The present sequence is a peptide fragment (epitope) of cysteine protease from Dermatophagoides pteronyssinus, which was used as an allergen in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antiallergic composition, useful for preventing and treating e.g. asthma, rhinitis or eczema, containing at least two of allergen, antihistamine and histamine synthesis inhibitor.
                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Isolated peptide(s) of dermatophagoides protein allergens - for diagnosis and treatment of sensitivity to house dust mite.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Group I, protein allergen, house dust mite; D. pteronyssinus; Der p I; homology; D. farinae; Der f I; group II; Der p II; Der f II; T-cell; peptiopes; fusion peptides; antigenic fragments; substitution; deletion; addition; chemical synthesis; chemical cleavage; recombinant techniques; allergic response; immunoglobulin B; IGB; immunotherapy; anaphylaxis; IGB-mediated responses; anergise; lymphokine secretion profile; modify; T cell subpopulations; unresponsive; immune response; tolerise.
                                                                                                                                                                                                                                                                                 The peptide is one of a series of overlapping peptides synthesised by standard techniques to cover the whole Dermatophagoides farinae Def pl sequence. The T cell epicopes of the protein were mapped by detection of the peptide's ability to stimulate T cell activity. The peptides may be used for diagnosis and treatment of sensitivity to house dust mite allergens. When administered to house dust mite sensitivity in the peptides are capable of modifying the allergic response to the allergens. The peptides may be modified for e.g. increasing solubility, enhancing therapeutic or preventive efficacy or stability. See also AAR34686-700 and AAR36398-490. (Updated on 25-WAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100.0%; Score 55; DB 2; Length 23; 100.0%; Pred. The sequences given in AAES1731-841 represent T-ċell epitopes derived from the group I and II protein allergens from the house dust mite D. farrinae and D. pteronyssinus, Der f. II. Der f. II. Der i I and Der p II. respectively. The Der f. II proteinsCC shows high homology having an identity of 88% with an identity of 81% between the two group I proteins (see also AARS1727-30). Fusion peptides may be produced which comprise at Cast two or these antigenic fragments. Each region of these fusion petides may be darived from the same, or different, mite allergens. The antigenicity. These peptides may be produced by chemical confidence their antigenicity. These peptides may be produced by chemical confidence their antigenicity. These peptides may be produced by chemical confidence their antigenicity. These peptides may be produced by chemical confidence their allergen or by recombinant techniques. These peptides of the protien allergen or by recombinant techniques. These peptides, when administered to a house dust mite sensitive individual to the allergen. The peptides do not bind to immunoglobulin E (19E), or bind 19E to a lesser extent than the full length protein allergen. This reduces the major complications of standard immunorherapy, which are 19E-mediated responses such as canaphylaxis. Exposure of mite allergens and do not participate in mounting an immune response upon exposure. Administration of the peptides may also modify the lymphokine secretion profile as compared with exposure to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

Claimed therapeutic compositions contain at least one of the peptides DP-21.2 and also at least one of the new peptides DP1-23.31, DP1-26.6, DPII-20.9, DPII-22.14 and DPII-25.17 The compositions are useful for treating sensitivity to house dust mite allergems. The peptides were identified by screening overlapping peptides derived from D.pterronyssinus and D.farinae group I and II allergems for T-cell reactivity in sensitised individuals. The present sequence is that of overlapping peptide DPI-9 (158-180). (Updated on 25-MAR-2003 to correct PR field.)
                                                       Compsns. contg. house mite allergen-derived peptide(s), some new - are used to treat allergy, and are stable, soluble and induce T cell non-responsiveness.

                                                                                                                                                                                                                                                                                                                                 The sequences given in AAR51711-841 represent T-cell epitopes derived from the group I and II protein allergens from the house dust mite D. farinae and D. pteronyssinus. Der f I. Der f II. Der p I and Der p II caspectively. The Der f II proteinser ship homology having an identity of 88% with an identity of 81% between the two group I proteins (see also AAR5172-30). Pusion peptides may be produced which comprise at least two or these antigenic fragments. Each region of these fusion petides may be derived from the same, or different, mite allergens. The antigenic fragments may be allered by substitution, deletion or addition to enhance their antigenicity. These peptides may be produced by chemical contigenic fragments and substitution, deletion or addition to enhance their antigenicity. These peptides may be condition allergen or by recombinant techniques. These peptides of the protien allergen or by recombinant continues. These peptides, or the fusion peptides, when administracd to a house dust mite sensitive individual, are capable of modifying the allergic response of the individual to the allergen. The peptides may tolerise or anergise appropriate T cell subpopulations such that they become unresponsive to mite allergens and do not participate in mounting can immune response upon exposure. Administration of the peptides may also modify the lymphoking such allergen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô
                                                                                                                                        - of major
                                                                                                                                 Isolated and/or modified peptides comprising T-cell epitopes - of major protein allergens of genus Dermatophagoides, used to treat or diagnose sensitivity to house dust mites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The present invention describes peptides for treating sensitivity to house dust mite allergens from the genus Dermatophagoides. Peptides within the scope of the invention comprise at least one T cell epitope, or preferably at least two T cell epitopes of a protein allergen selected from the allergens Der p I, Der p II, Der f I, or Der f II. The invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Dermatophagoides allergen peptides - useful for treating house dust mite
                                                                                                                                                                                          genus Dermatophagoides; major protein allergen, T cell epitope; Der p I;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes peptides for treating sensitivity to house dust mite allergens from the genus Dermatophagoides. Peptides within the scope of the invention comprise at least one T cell epitope, or preferably at least two T cell epitopes of a protein allergen selected from the allergens Der p I, Der p II, Der f I, or Der f II. The invention also describes modified peptides having similar or enhanced therapeutic properties as the corresponding, naturally occurring allergen, but having reduced side effects. AAM71912 to AAM72000, and AAM7257 to AAM72330 represent peptides from the present invention. (Updated on 25-MAR-2003 to correct PR field.) (Updated on 27-AUG-2003 to correct OS field.)

This invention describes a novel method (I) for detecting whether an individual is sensitive to Dermatophagoides (house dust mites). The method involves detecting sensitivity to house dust mites in patients, comprising combining a blood sample from the individual with 1 or more isolated T cell epitopes of the protein allergens I and II ((DP I) and (DP II)) from Dermatophagoides (house dust mites). 32 T cell epitopes with varying, defined amino acids sequences (given in the specification) may be used in (I). The sample and allergens are combined under conditions appropriate for the binding of blood components with the sensitivity of the patient to house dust mites (I) may be used to screen individuals for sensitivity to Dermatophagoides (house dust mites). The house dust mites of the patient counce of a variety of allergic disorders such as asthma, rhiltis and ectopic dermatitis. AAY50360-Y50542 and AAY50544-Y50555 represent house dust mite allergen peptide fragments derived from Der p I, Der f II, Der f II and Der f II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
Screening individuals for allergic reactions to T cell epitopes of major allergens from house dust mites.

This invention describes a novel method (I) for detecting whether an individual is sensitive to Dermatophagoides (house dust mites). The method involves detecting sensitivity to house dust mites in patients, comprising combining a blood sample from the individual with 1 or more isolated T cell epitopes of the protein allergens I and II (UP I) and (DP II)) from Dermatophagoides (house dust mites). 32 T cell epitopes of the protein allergens I and II (UP I) and with a varying, defined amino acids sequences (given in the specification) may be used in (I). The sample and allergens are combined under conditions appropriate for the binding of blood components with the political and allergens are combined under conditions appropriate for the binding is then indicative of the sensitivity of the patient to house dust mites. (I) may be used to screen individuals for sensitivity to Dermatophagoides (house dust mites). The house dust mite is a major cause of a variety of allergic disorders such as asthma, rhinitis and ectopic dermatitis. AAY50360-Y50542 and AAV5046-Y50555 in the II, per f I and Der f II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The invention relates to an isolated peptide of the major protein allergens of the genus Dermatophagoides, which comprises at least one T cell group of a protein allergen from Der p (PP) I, DP II, Der f (DF) I or DF II. The isolated peptide comprises at least two regions, each region comprising at least one T cell group of a protein allergen of the ganus Dermatophagoides. The regions are derived from the same or different protein allergens of the genus Dermatophagoides. The peptides are useful for treating house dust mite allergy in humans. The peptides are also useful for detecting or diagnosing sensitivity to house dust mite protein allergens. The peptides have agained therapeutic properties as the naturally-occurring allergen, but have the moduced side effects, and increased solubility and stability. The present sequence represents an allergenic T-cell epitope containing peptide derived from the Dermatophagoides allergenic proteins
                                                                                                                                                                                                                                                                                                                                                                                                                            Peptides comprising T cell groups of the major allergens from Dermatophagoides (house dust mites), useful for treating house dust mite allergy in humans, and for diagnosing sensitivity to house dust mite protein allergens.

Isolated peptide(s) of dermatophagoides protein allergens - for diagnosis and treatment of sensitivity to house dust mite.
                                                                                                                                                                                    Isolated peptide(s) of dermatophagoides protein allergens - for diagnosis and treatment of sensitivity to house dust mite.
                                                                                                                                                                                                                                                                   The peptide is one of a series of overlapping peptides synthesised by standard techniques to cover the whole Dermatophagoides farinae Def pl sequence. The T cell epicopes of the protein were mapped by detection of the peptide's ability to stimulate T cell activity. The peptides may be used for diagnosis and treatment of senshtivity to house dust mite allergens. When administered to house dust mite sensitive individuals, the peptides are capable of modifying the allergic response to the allergens. The peptides may be modified for e.g. increasing solubility, enhancing therapeutic or preventive efficacy or stability. See also ARR36398-490. (Updated on 25-MAR-2003 to correct PN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated peptide of the major protein allergens of the genus Dermatophagoides, which comprises at least one T or Il group of a protein allergen from Der p (DP) I, DP II, Der f (DF) I or DF II. The isolated peptide comprises at least two regions, each region comprising at least one T cell group of a protein allergen of the genus Dermatophagoides. The regions are derived from the same or different protein allergens of the genus Dermatophagoides. The peptides are useful for treating house dust mite allergy in humans. The peptides are also useful for decetting or diagnosing sensitivity to house dust mite protein allergens. The present peptides have similar or enhanced therapeutic properties as the naturally-occurring allergen, but have reduced side effects, and increased solubility and stability. The present derived from the Dermatophagoides allergenic proteins
                                                                                                                                                                                                                                                                                                                                                                              mite

The peptide is one of a series of overlapping peptides synthsised by standard techniques to cover the whole Dermatophagoides pteronyssinus Der pI sequence. The I cell epitopes of the protein were mapped by detection of the peptide's ability to simulate T cell activity. The peptides may allergens. When administered to house dust mite ensitivity to house dust mite allergens. When administered to house dust mite ensitive individuals, the peptides are capable of modifying the allergic response to the allergens. The peptides may be modified for e.g. increasing solubility, enhancing therapeutic or preventive efficacy or stability. See also AAR34686-700 and AAR345898-490. (Updated on 25-MAR-2003 to correct PN field.)

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 10,

B;Accession: A197203, 1980

A;Accession: A15398; WUD: 81006769; PMID: 6997283

A;Accession: A15398
                   A Accession: $23186
A. Molecule type: protein
A. Molecule type: protein
A. Molecule type: protein
A. Molecule type: protein
A. Experimental Source: brain
C. Function:
A. Description: may play a physiological role in the regulation of cardiovascular and gast A. Note: neurokinin A is derived by post-translational processing of preprotachykinin A is derived arboxyl end; tachykinin
F:10/Modified site: amidated carboxyl end (Met) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             C,Accession: A38081

Antiallergic compositions containing an anti-histamine, a histamine synthesis inhibitor, and optionally an allergen or nucleic acid coding for the allergen.

Claim 14; Page 11; 32pp; French.

The invention relates to antiallergic compositions containing an antihistamine, a histamine synthesis inhibitor, and optionally an allergen or isolated mucleic acid molecule that has at least one polymotheotide sequence coding for the allergen, together with a pharmaceutical carrier. The pharmaceutical composition of the invention is useful as a nonspecific antiallergic treatment, and also useful in the treatment of allergic antiallergic asthmic allergic asthmic allergic casthmic allergic and acopical eczema. This sequence represents a peptide of a cysteine protease epitope region relating to the antiallergic

compositions of the invention

ABB98535 standard; peptide; 10 AA.

```
The present invention relates to house dust mite (Dermatophagoides pteronyssinus) Der pl antigen peptides containing human CD8 cell peptides. The peptides of the invention are useful in the treatment of human or animal patients, particularly to raise an immune response to the Der pl antigen. They are useful in the treatment and prevention of altergies to the major house dust mite antigen, and to monitor disease activity in atopic patients. ABULIO'8-ABULI146 represent house dust mite ber pl antigen peptides containing CD8+ T-cell epitopes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New peptide fragments of the Der pl antigen of the house dust mite Dermatophagoides pteronyssinus contain a human CD8+ T cell epitope ar are useful to treat and prevent allergy to the major house dust mite
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 House dust mite; Der pl antigen; human CD8 cell epitope; allergy; immune response; atopic patient; CD8+ T-cell epitope; antiallergic.
                                                                                                                                                        House dust mite; Der pl antigen; human CD8 cell epitope; allergy; immune response; atopic patient; CD8+ T-cell epitope; antiallergic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       92.7%; Score 51; DB 6; Length 9; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to an antiallergic pharmaceutical composition (I) comprising a pharmaceutical carrier containing an active agent combination of at least two of: an allergen; an antihistamine; and a histamine synthesis inhibitor. (I) is used for treating or preventing allergic synthesis inhibitors, especially allergic asthma, allergic allergic cacacions, especially allergic asthma, allergic printits or allergic eczema, in bables, children or adults. The present sequence is a peptide fragment (epitope) of cysteine protease from Dermatophagoides pteronyssinus, which was used as an allergen in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antiallergic composition, useful for preventing and treating e.g. asthma, rhinitis or eczema, containing at least two of allergen, antihistamine and histamine synthesis inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                         Gaps

The present invention relates to house dust mite (Dermatophagoides pteronyssinus) Der pl antigen peptides containing human CD8 cell epitopes. The peptides of the invention are useful in the treatment of human or animal patients, particularly to raise an immune response to the Der pl antigen. They are useful in the treatment and prevention of allergies to the major house dust mite antigen, and to monitor disease activity in atopic patients. ABULI078-ABULI146 represent house dust mite Der pl antigen peptides containing CD8+ T-cell epitopes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   peptides released by beta-1,2-xylosyltransfease by The specification describes a plant-derived beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Beta-1,2-xylosyltransfease; beta 1,2-linked xylose; beta-linked mannose; N-linked oligosaccharide; storage glycoprotein; allergenicity; soybean.
                                                                                                                                           New peptide fragments of the Der pl antigen of the house dust mite

1,2-xylosyltransferase, where the enzyme adds a beta 1,2-linked xylose to the beta -linked mannose on the N-linked oligosaccharides of storage glycoproteins. Yylose units on N-linked oligosaccharides may play a critical role in allergenicity of plant derived glycoproteins and may also be important in regulating the structure of the oligosaccharide chains and the targeting of these proteins. Purification of a xylosyltransferase is useful in order to study its properties and specificities in the absence of incerfering activities and possible inhibitors. The antibody can be used to determine the localization of the xylosyltransferase in suspension culture soybean cells and the distribution and level of the enzyme in plants as well as its levels at various stages of growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to Arabidopsis thaliana beta 1,2-xylosyltransferase plant protein and its cDNA molecule. Beta 1,2-xylosyltransferase protein nucleic acid [PNA] molecule is useful for producing transgenic plants and plant cells with increased efficiency in producing glycoproteins. The invention also relates to a method for producing glycoproteins. The glycoproteins which is suitable for medical use. Beta 1,2-xylosyltransferase DNA is useful for immobilisation on DNA microarrays, e.g. for finding homologous sequences or expression studies in plants suppression or over expression and production of beta 1,2-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel DNA molecule encoding beta 1,2-xylosyltransferase, useful for producing transgenic plants and plant cells with increased efficiency in producing glycoproteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Beta 1,2-xylosyltransferase; transgenic plant; medicament; glycoprotein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    xylosyltransferase. The present sequence is soybean peptide 3 which is used for analysing Arabidopsis thaliana beta 1,2-xylosyltransferase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method for treating cancer or a noncarcer hyperproliferative cell disease or disorder in a patient, which comprises administering to the patient antibody, an EphA2 antibody, an EphA2 antibody, an EphA2 antibody, an EphA2 ephacentic antibody, an EphA2 ephacentic antibody or an antibody that binds antibody, an exposed EphA2 epitope antibody, or an antibody that binds EphA2 with a K-off of less than 3 x 10-3 s-1. Also described: (1) and a pharmaceutical composition comprising a therapeutic amount of (1) and a pharmaceutical carrier; (2) a cell line that produces (1); (3) a hybridoma deposited with the ATCC accession number PTA-4572, PTA-4573 or PTA-4574; (4) an isolated nucleic acid comprising a nucleic acid described above; (6) a host cell comprising the vector comprising the nucleic acid described above; (6) a host cell comprising the vector; (7) methods of identifying the EphA2 antibody; (5) a vector comprising the nucleic acid described above; (6) a host cell comprising the vector; (7) methods of identifying the EphA2 antibody; (5) a vector cells having a cancer cell phenotype or that preferentially binds an EphA2 epitope cancer cells, and (8) a method of diagnosing or monitoring the efficacy of therapy for cancer in a patient known to or suspected to have cancer. (1) has cytostatic, antiasthmatic,

The invention may be useful for the production of compounds with a virucide activity or the development of a vaccine. The polypeptide or its fragments may be useful as a therapeutic agent. It is also useful for the manufacture of a medicament for treating or preventing an infection with the pathogenic virus. The present sequence is that of a human papillomavirus (HPV) epitope peptide of the
antipsoriatic, antiinflammatory, vasotropic and respiratory activities, and can be used in gene therapy. The composition and methods are useful in managing, diagnosing, preventing or treating hyperproliferative cell diseases (i.e. metastatic cancer) or non-cancer hyperproliferative cell diseases or disorders, such as asthma, postiasis, inflammatory bowel disease, smooth muscle restences, endothelial restencis; Crohn's disease or chronic obstructive pulmonary disease. They may also be used to monitoring the efficacy of therapy for cancer in a patient known to or suspected to have cancer, and in screening for anti-cancer drugs. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polypeptide encoded by an alternative reading frame of a pathogenic virus comprising an antigenic determinant, useful for treating or preventing an infection with the pathogenic virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

This invention relates to a novel polypeptide encoded by an alternative reading frame of a pathogenic virus, where the polypeptide starts with a methionine amino acid residue, which comprises an antigionic determinant and more than 7 amino acid residues. The invention may be useful for the production of compounds with a virucide activity or the development of a vaccine. The polypeptide or its fragments may be useful as a therapeutic agent. It is also useful for the manufacture of a medicament for treating or preventing an infection with the pathogenic virus. The present sequence is that of a human papillomavirus (HPV) epitope peptide of the
                                                                                                                                                                                                                                                                                                            New polypeptide encoded by an alternative reading frame of a pathogenic virus comprising an antigenic determinant, useful for treating or preventing an infection with the pathogenic virus.

The invention may be useful for the production of compounds with a virucide activity or the development of a vaccine. The polypeptide or its fragments may be useful as a therapeutic agent. It is also useful for the manufacture of a medicament for treating or preventing an infection with the pathogenic virus. The present sequence is that of a human papillomavirus (HPV) epitope peptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polypeptide encoded by an alternative reading frame of a pathogenic virus comprising an antigenic determinant, useful for treating or preventing an infection with the pathogenic virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

This invention relates to a novel polypeptide encoded by an alternative reading frame of a pathogenic virus, where the polypeptide starts with a methionine amino acid residue, which comprises an antiganic determinant and more than 7 amino acid residues. The invention may be useful for the production of compounds with a virucide activity or the development of a vaccine. The polypeptide or its fragments may be useful as a therapeutic agent. It is also useful for the manufacture of a medicament for treating or preventing an infection with the pathogenic virus. The present sequence is that of a human papillomavirus (HPV) epitope peptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention relates to a novel polypeptide encoded by an alternative reading frame of a pathogenic virus, where the polypeptide starts with a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polypeptide encoded by an alternative reading frame of a pathogenic virus comprising an antigenic determinant, useful for treating or preventing an infection with the pathogenic virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                pathogenic virus; alternative reading virucide; vaccine; therapeutic agent;

This invention describes novel antibodies that immunospecifically bind to be Lymphocyte Stimulator (BLyS) polypeptides. Buys is a member of the tumour necrosis factor (TNP) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunosdulatory, antitheumatic and antiAIDS activity and can be used in vaccinas to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BryS in biological samples and may be used in this way to disagnose disease associated with aberrant expression of BLyS. They may also be
methionine amino acid residue, which comprises an antigenic determinant and more than 7 amino acid residues. The invention may be useful for the production of compounds with a virucide activity or the development of a vaccine. The polypeptide or its fragments may be useful as a therapeutic agent. It is also useful for the manufacture of a medicament for treating or preventing an infection with the pathogenic virus. The present sequence is that of a human papillomavirus (HPV) epitope peptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 BLys, B lymphocyte stimulator, TNF superfamily, human, cytostatic, tumour necrosis factor; B cell proliferation, B cell differentiation, immunosuppressive, immunostimulant, immunomodulatory, annitheumatic; antiAIDS; vaccine, cancer; immune, autoimmune disorder; immunodeficiency; systemic lupus erythematosus, rheumatoid arthritis, CVID, AIDS, common variable immunodeficiency; acquired immunodeficiency syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antibodies against B Lymphocyte Stimulating polypeptides, useful for the diagnosis and treatment of cancers and immune disorders.
                                                                                                                                                                                                                                                      Gaps

This invention relates to novel antibodies that immunospecifically bind to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to chromosome 13434 and encodes a protein that is a member of the tumour necrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single chain antibody molecules (scrye) derived, preferably, from the variable heavy CDR3 region that immunospecifically bind to a polypeptide, or fragment thereof, of either human, murine, rat or monkey BLyS. The present invention refers to the use of such antibodies in various methods for the detection, diagnosis and prognosis of diseases related to the aberrant expression or inappropriate function of BLyS or its receptor. As such, these compositions are useful for identifying immune disorders including mysathenia gravis and multiple sclerosis, inflammatory disorders e.g. asthma and rheumatoria architis, infectious diseases such as AIDS and proliferative disorders including leukaemia, carcinoma and administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, immunodeficiency (e.g. common variable immunodeficiency (CVID) and acquired immunodeficiency syndhome (AIDS)). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method of Novel antibody that immunospecifically binds to a B lymphocyte stimulator (BLys), useful for detecting and treating diseases or disorders e.g. rheumatoid arthritis, asthma and leukemia. antibody; B lymphocyte stimulator; BLyS; tumour necrosis factor; B cell proliferation; differentiation; scFv, myasthenia gravis; multiple sclerosis; asthma, rheumatoid arthritis; AIDS; leukaemia; carcinoma; lymphoma; antirheumatic; antiarthritic; neuroprotective; antiinflammatory; antiathmatic; antiallergic; cytostatic. scrv VHCDR3 peptide that immunospecifically binds BLyS SegID 2740. .; 0 Score 26; DB 5; Length 8; Pred. . 0 The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78168 and ABZR01789-ABR01861). The genes and proteins are useful for eliciting a humonal or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response i Gaps ò vaccine; cancer; immune response; HLA; 1; Indels Hubert Length 8; Human cancer-related protein 185P3C3 HLA peptide #1010. 3 47.3%; Score 26; DB 7; I 37.5%; Pred. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Antiallergic compositions containing an anti-histamine, a histamine synthesis inhibitor, and optionally an allergen or nucleic acid coding for the allergen.

Claim 14; Page 11; 32pp; French.

The invention relates to antiallergic compositions containing an antihistamine, a histamine synthesis inhibitor, and optionally an allergen or isolated nucleic acid molecule that has at least one polyuncheotide sequence coding for the allergen, together with a pharmaceutical carrier. The pharmaceutical composition of the invention is useful as a nonspecific antiallergic treatment, and also useful in the treatment of allergic hypersensitivity, allergic asthergic rhinitis, and allergic and atopical eczema. This sequence represents a peptide of a cysteine protease epitope region relating to the antiallergic of a

The peptide is one of a series of overlapping peptides synthsised by standard techniques to cover the whole Dermatophagoides pterchyssinus Der pla sequence. The cell epitopes of the protein were mapped by detection of the peptide's ability to stimulate T cell activity. The peptides may be used for diagnosis and treatment of sensitivity to house dust mite allergens. When administered to house dust mite sensitive individuals, the peptides are capable of modifying the allergic response to the allergens. The peptides may be modified for e.g. increasing solubility, and handled to preventive efficacy or stability. See also ARR34686-700 and AAR3699-490. (Updated on 25-MAR-2003 to correct PN field.)

 The present invention relates to an antiallergic pharmaceutical composition (1) comprising a pharmaceutical carrier containing an active agent combination of at least two of: an allergen; an antihisteramine; and a histamine synthesis inhibitor. (1) is used for treating or preventing allergic hypersensitivity reactions, especially allergic asthma, allergic thintis or allergic cazama, in bablies, children or adults. The present sequence is a peptide fragment (epitope) of cysteine protease from Dermatophagoides pteronyssinus, which was used as an allergen in the
 Antiallergic composition, useful for preventing and treating e.g. asthma, rhinitis or eczema, containing at least two of allergen, antihistamine and histamine synthesis inhibitor.

WPI; 1994-126807/15

Isolated and/or modified peptides comprising T-cell epitopes - of major protein allergens of genus Dermatophagoides, used to treat or diagnose sensitivity to house dust mites.

English. Claim 28; Page 67; 154pp;

The sequences given in AARB1731-841 represent T-cell epitopes derived from the group I and II protein allergens from the house dust mite D. farinae and D. perconyssimus, Der f II, Der f II, Der p I and Der p II respectively. The Der f II proteinsSCC shows high homology having an identity of 88%, with an identity of 81% between the two group I proteins (see also AAR51272730). Pushion peptides may be produced which compprise at least two or these antigenic fragments. Bach region of these fusion petides may be derived from the same, or different, mite allergens. The neigenic fragments may be altered by substitution, deletion or addition to the name their antigenicity. These peptides may be produced by chemical contained a least two or these peptides, or the fusion peptides, when administered to techniques. These peptides, or the fusion peptides, when administered to a lower dust mite sensitive individual to the allergen. The peptides do not bind to immunoglobulin E (IgE), or bind IgE to a lesser extent than the full length protein allergen. This reduces the major complications of standard immunotherapy, which are IgE-mediated responses such as anaphylaxis. Exposure of mite allerger prefers to these peptides may be contained and anaphylaxis. Exposure of mite allergic patients to these peptides may be contained to the protein allergent or the complication of anaphylaxis and anaphylaxis and percent and anaphylaxis and percent and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphylaxis and anaphy become unresponsive to mite allergens and do not participate in mounting an immune responsive to exposure. Administration of the peptides may also modify the lymphokine secretion profile as compared with exposure to the naturally occuring mite protein allergen

ö The present invention describes peptides for treating sensitivity to house dust mite allergens from the genus Dermacophagoides. Peptides within the scope of the invention comprise at least one T call epitope, or preferably at least two T call epitopes of a protein allergen selected from the allergens Der p I, Der p II, Der f I, or Der f II. The invention also describes modified peptides having similar or enhanced therapeutic properties as the corresponding, naturally occurring allergen, but having reduced side effects, AAM71912 to AAM7200, and AAM72027 to AAM72330 represent peptides from the present invention. (Updated on 25-MAR-2003 to correct PR field.) (Updated on 27-AUG-2003 to correct OS field.) Screening individuals for allergic reactions to T cell epitopes of major allergens from house dust mites.

Claim 3m; Col 129-130; 158pp; English.

This invention describes a novel method (I) for detecting whether an individual is sensitive to Dermatophagoides (house dust mites). The method involves detecting sensitivity to house dust mites in patients, comprising combining a blood sample from the individual with lor more isolated T cell epitopes of the protein allergens I and II (DP I) and (DP II)) from Dermatophagoides (house dust mites). 32 T cell epitopes with varying, defined amino acids sequences (given in the specification) may be used in (I). The sample and allergens are combined under conditions appropriate for the binding of blood components with the polypeptides. The extent of binding is then indicative of the sensitivity of the patient to house dust mites. (I) may be used to screen individuals for sensitivity to Dermatophagoides (house dust mites). The house dust mite is a major cause of a variety of allergic disorders such as asthma, rhinitis and ectopic dermatitis. AANSO360-Y50542 and AANSO366-Y50555 RESULT 9

 The invention relates to an isolated peptide of the major protein allergens of the genus Dermatophagoides, which comprises at least one T cell group of a protein allergen from Der p (DP) I, DP II, Der f (DF) I or DF II. The isolated peptide comprises at least two regions, each region comprising at least one T cell group of a protein allergen of the genus Dermatophagoides. The regions are derived from the same or different protein allergens of the genus Dermatophagoides. The peptides are useful for treating house dust mite allergy in humans. The peptides are also useful for detecting or diagnosing sensitivity to house dust mite protein allergens. The present peptides have similar or enhanced therapeutic properties as the naturally-occurring allergen, but have reduced side effects, and increased solubility and stability. The present derived from the Dermatophagoides allergenic proteins
 Peptides comprising T cell groups of the major allergens from Dermatophagoides (house dust mites), useful for treating house dust mite allergy in humans, and for diagnosing sensitivity to house dust mite protein allergens.

 Isolated peptide(s) of dermatophagoides protein allergens - for diagnosis and treatment of sensitivity to house dust mite.
 The peptide is one of a series of overlapping peptides synthesised by standard techniques to cover the whole Dermatophagoides farinae Def pl sequence. The T cell epitopes of the protein were mapped by detection of the peptide sability to stimulate T cell activity. The peptides may be used for diagnosis and treatment of sensitivity to house dust mite allergens. When administered to house dust mite ensitivity to house dust mite the peptides are capable of modifying the allergic response to the allergens. The peptides may be modified for e.g. increasing solubility, enhancing therapeutic or preventive efficacy or stability. See also AAR36398-490. (Updated on 25-MAR-2003 to correct PN

 The peptide is one of a series of overlapping peptides synthsised by standard techniques to cover the whole Dermatophagoides pieronyssinus Der pi sequence. The T cell epitopes of the protein were mapped by detection of the peptide ability to stimulate T cell activity. The peptides may be used for diagnosis and treatment of sensitivity to house dust mite allergens. When administered to house dust mite sensitivite individuals, the peptides are capable of modifying the allergic response to the the peptides and be modified for e.g. increasing solublity, enhancing therapeutic or preventive efficacy or stability. See also ARR3689-490. (Updated on 25-MAR-2003 to correct PN
 Isolated peptide (s) of dermatophagoides protein allergens - for diagnosis and treatment of sensitivity to house dust wite.

Isolated and/or modified peptides comprising T-cell epitopes - of major protein allergens of genus Dermatophagoides, used to treat or diagnose sensitivity to house dust mites.

Disclosure; Fig 3; 154pp; English

The sequences given in AARS1731-841 represent T-cell epitopes derived from the group I and II protein allergens from the house dust mite D. farinae and D. personyssinus, Der I if, Der I II, Der I II noncleap I and Der p II respectively. The Der I II proteinsCC shows high homology having an identity of 88% with an identity of 81% between the two group I proteins (see also AARS1727-30). Fusion peptides may be produced which comprise at least two or these antigenic fragments. Each region of these fusion petides may be derived from the same, or different, mite allergens. The antigenicity. These peptides may be produced by chemical confiques. These peptides way be produced by chemical synthesis, chemical cleavage of the protien allergen or by recombinant to enhance their antigenicity. These peptides, when administered to a house dust mite sensitive individual, are capable of modifying the allergic response of the individual to the allergen. The peptides do not bind to immunoslobulin E (15E), or bind 19E to a lesser extent than the full length protein allergen. This reduces the major complications of standard immunotherapy, which are 19E-mediated responses such as manylaxis. Exposure of fite allergens and do not participate in mounting an immune responsive to mite allergen and do not participate in mounting an immune response section protein allergen and compared with exposure to the naturally occuring mite protein allergen and ecompared with exposure to the naturally occuring mite protein allergen.

(ANTI-) ANTIALIS SARL.

Trehin Y; Loria E, Terrasse G,

WPI; 2002-750636/81.

Antiallergic compositions containing an anti-histamine, a histamine synthesis inhibitor, and optionally an allergen or nucleic acid coding for the allergen.

Claim 14; Page 11; 32pp; French.

The invention relates to antiallergic compositions containing an anti-histamine, a histamine synthesis inhibitor, and optionally an allergen or isolated mucleic acid molecule that has at least one polymicleotide sequence coding for the allergen, together with a pharmaceutical carrier. The pharmaceutical composition of the invention is useful as a non-specific antiallergic treatment, and also useful in the treatment of allergic hypersensitivity, allergic asthma, allergic rhinitis, and allergic and atopical eczema. This sequence represents a peptide of a cysteine protease epitope region relating to the antiallergic

 The present invention relates to an antiallergic pharmaceutical composition (1) comprising a pharmaceutical carrier containing an active agent combination of at least two of: an allergon; an antihistemine; and a histamine synthesis inhibitor. (1) is used for treating or preventing allergic hypersensitivity reactions, especially allergic asthma, allergic hinthis or allergic cacama, in bablies, children or adults. The present sequence is a peptide fragment (epitope) of cysteine protease from Dermatophagoides pteronyssinus, which was used as an allergen in the
 Antiallergic composition, useful for preventing and treating e.g. asthma, rhinitis or eczema, containing at least two of allergen, antihistamine and histamine synthesis inhibitor.

The present invention relates to a method of detecting Cryptosporidium in biological and environmental samples, and of diagnosing cryptosporidiosis. This involves obtaining a sample and contacting it with Cryptosporidium GP900. PG8 or cryptospain antigen, antibody, DNA or RNA, or its variant, mutant or fragment. The method is also useful for detecting and identifying individual Cryptosporidium isolates based on the genetic characteristics, and for diagnosis of prior or concurrent Cryptosporidium infection. The present sequence is a C. parvum peptide sequence used in the exemplification of the invention

The sequences given in AAR77350-53 are peptides derived from the canonical Haemonchus contortus cysteine proteinase molecule which were used in the design of the primers given in AAQ94240-43. These primers were used in the cloning of CDNA fragments from the cysteine protienase gene, such as DN.1, DN.2, DN.3, DM.4, DM.4a and DM.5 (see also AAQ94246-51). The amplified fragments may be expressed in a recombinant cell for the production of antigens. These antigens may be used in the preparation of a vaccine against helminth parasites in a human or non-human animal

The present invention describes a composition (1) which comprises at least one human leukocyte antigen (HLA) binding peptide comprising an soluted, prepared epitope comprising one of 547 8-11 residue amino acid sequences (51), given in AAB75803 to AAB7649. (1) has cytotetatic, invention, hepatotropic, antiinflammatory, anti-HIV (human conditions of given in AAB75803 to AAB7649. (1) has cytotetatic, immunodeficiency virus) and protozoacide activities, which can be used in vaccine production and is an inducer of cytotoxic T-cell response. (1) is useful for inducing a cytotoxic T cell response against a preselected antiper in a patient expressing a specific major histocompatibility complex (MHC) class I allele, by contacting cytotoxic T cells (CTLs) from the patient with (1). (1) is useful as a vaccine to treat and/or prevent viral infection and cancer such as prostate cancer, hepatitis B, the patients C, human papilloma virus (HPV) infection, cytomegalovirus (CMV), acquired immunodeficiency syndrome (AIDS), renal carcinoma, cervical carcinoma, malaria, and condyloma acuminatum
 ö
 Tumour homing molecules and their conjugates - useful for, e g. directing linked moiety to tumour containing angiogenic vasculature.
 AAW60390-432 represent peptides recovered from mouse melaanomas. The peptides are tumour homing peptides, and are identified by in vivo panning comprises administering a library of diverse peptides to a subject having a tumour, collecting a sample of the tumour, identifying a peptide that homes to the tumour, collecting a sample of normal tissue corresponding to the tumour, and determining that the
 Composition comprising human leukocyte antigen binding peptide which comprises isolated, prepared epitope useful for treating viral infections such as acquired immunodeficiency syndrome, and cancer.

This invention describes novel peptides which home to angiogenic vasculature, specifically of a tumour and which have anti-tumour, anti-inflammatory, anti-angiogenic and anti-arthritic activity. Such molecules are identified by treating a purified NGR receptor with a test compound and identifying compounds that bind specifically to the NGR receptor. The peptides of the invention are inhibitors of angiogenesis and can be used to produce conjugates for delivering agents to angiogenic vasculature, or produce conjugates may be directed to non-tumour angiogenic vasculature, e.g. that present in inflammatory, regenerating or wounded triscularly anticancer drugs or an immaging agent, for diagnosis or prognosis. These conjugates may be directed to non-tumour angiogenic vasculature, e.g. that present in inflammatory, regenerating or wounded triscularly effor treatment of macular degenerating or returnorated arthritis. The peptides provide specific targeting to the circularly engorting vasculature, since the NGR receptor is exposed to the circularly and in angiogenic vasculature. Precise targeting should reduce the systemic toxicity of anticancer drugs in the conjugates. Complete killing of all target cells may not be essential finemed or partial dended and or endochelial may result in an occlusive thrombus, and endothelial cells are unlikely to become resistant to anticancer agents nor to lose the targeting receptor. AMM93622-W93809 and
peptide that homes to the tumour is not present in the normal tissue. The tumour homing peptides can be linked to a moiety (e.g. doxorubicin), and used to direct the moiety to a tumour

 The present invention relates to homing pro-apoptotic conjugates, comprising of a tumour homing molecule that selectively homes to a mammalian cell type or tissue, linked to an antimicrobial peptide. The homing pro-apoptotic conjugates are selectively internalised by the mammalian cell type or tissue and exhibits high toxicity, especially to angiogenic vasculature. The antimicrobial peptide has low mammalian cell toxicity when not linked to the tumor homing molecule. The conjugates are useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and prostate cancer or melanoma. The present sequence is a homing peptide isolated in the present invention, which can be conjugated to an antimicrobial peptide to make the homing pro-apoptotic conjugates of the present invention
AAW93843-44 are examples of tumour homing peptides used in the invention
 Homing pro-apoptotic conjugate comprising a tumor homing molecule that selectively homes to a mammalian cell type or tissue linked to an antimicrobial peptide; useful for the treatment of prostate cancer.

The invention relates to vaccines and cryptopain protein for diagnosis and treatment of Cryptosporidium species infection. Cryptopain protein can be expressed by standard recombinant methodology. The vaccines comprising the cryptopain protein or its fragments are useful for active immunization of animals and humans against Cryptosporidium infection, or for production of passive immune products in admixture with an adjuvant. Cryptopain can be used for prophylactic, therapeutic, diagnostic and detection purposes. The present sequence represents a peptide fragment of the C. parvum cryptopain protein
 Detecting Cryptosporidium in biological and environmental samples and diagnosis of cryptosporidiosis involves, contacting the sample with Cryptosporidium GP900, P68 or cryptopain antigen, antibody, DNA or RNA.

 The patent discloses novel chimeric prostate-homing pro-apoptotic peptide which comprises a prostate-homing peptide linked to an antimicrobial peptide, where the chimeric peptide is selectively internalised by and exhibits high toxicity to prostate tissue and where the antimicrobial peptide has low mammalian cell toxicity when not linked to prostate homing peptide. The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is a tumour homing peptide from mouse B16B15b melanoma. This sequence is useful in the homing of pro-apoptotic

The present invention relates to a method of detecting Cryptosporidium in biological and environmental samples, and of diagnosing cryptosporidiosis. This involves obtaining a sample and contacting it with Cryptosporidium GP900, P68 or cryptopain antigen, antibody, DNA or RNA, or its variant, mutant or fragment. The method is also useful for detecting and identifying individual Cryptosporidium isolates based on the genetic characteristics, and for diagnosis of prior or concurrent Cryptosporidium infection. The present sequence is a C. parvum peptide sequence used in the exemplification of the invention
 The invention relates to an antibody produced against and binding to Cryptosporidium antigen, cryptopain. The invention also provides polynucleotides encoding cryptopain which is a cathepsin L-like cysteine proteinase. The antibody is useful for detecting and treating Cryptosporidium infection, for providing passive immunity or for inhibiting existing Cryptosporidium infection. The present sequence is Cryptosporidium parvum cryptopain active site fragment comprising conserved Asn residue.

/ clone_lib="mouse lokb plasmid UUGCIM library"
/ note="Weetor: PWD42nv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resources (Accuments/Anares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end repaired with T4 DNA polymerase and T4
polynucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pwD42 (gi|4732114|gb|AR129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
chemically-competent E. coli XII0-Gold (Stratagene) cells
and selected for ampicillin resistance."

Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and reatment of cancer.

Claim 1; Page 63; 219pp; English

The invention relates to a reporter construct comprising: (a) an estrogen response segment having 5 or more estrogen response elements (ERB); (b) a promoter segment having at least one promoter nucleic acid sequence; and (c) a nucleotide sequence that encodes a reporter polypeptide, where the nucleotide sequence is operably linked to the promoter segment and the

```
ct that are preferentially transcribed in the metastatic breast tumour cilsus (i.e. are upregulated in metastatic breast tumour cells). AAZ86577 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or incommentation that are are downregulated in metastatic breast tumour cells). AAZ86577 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells. These transcripts can be used for disquosis, prognosis, monitoring and transcripts can be used for disquosis, prognosis, monitoring and transcripts can be used for disquosis, prognosis, monitoring and transcripts can be used to disected. There is a compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also riboxymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines, for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effecter immune, hears.
 ö
 New reporter construct for identifying and isolating estrogen-responsive cells comprises an estrogen response segment, a promoter segment and a nucleotide sequence that encodes a reporter polypeptide.

The invention relates to a novel quantitative method for adding linear polynucleotide to solution containing a cation. The linear polynucleotide contains telomere repeat sequence with donor at one edge portion and acceptor at another edge portion. The optical detection is performed using this linear polynucleotide. The method of the invention is useful in medical fields such as clinical laboratory test and fields with cation fixed assay. The present sequence is used in the exemplification of the

The invention relates to a process for making a genetically engineered Neisserial strain (preferably Neisseria meningitidis serogroup B) in which the lippoligosaccharide (LOS) immunotype is fixed or locked. A feature of the meningococal LOS is the reversible, high frequency switching of expression (phase variation) of terminal LOS structures, which is an obstacle to the development of a cross-protective vaccine based on the use of LOS as the antigen. The process of the invention involves engineering a Neisserial strain such that the homopolymeric nucleotide tract of a phase variable LOS synthesis gene (specifically 19th or 19tG) is reduced in length (whilst maintaining the open reading frame), resulting in gene expression which is less phase variable. The method of the invention can be used to produce a Neisserial strain with a fixed Li or Li immunotype, which can be used in the manufacture of vaccines (particularly multivalent vaccines) against neisserial disease, especially meningococal disease. The present squence represents the disrupted polyc tract of the constitutively expressed Neisseria

```
This invention describes a novel in vitro method for identifying genes that are significant for facial skin in humans. The method comprises recovering, from facial skin, a first mixture of genetically expressed (transcribed and optionally translated) factors (i.e. proteins, mRNA or their fragments), recovering a second, similar mixture from some other human tissue, preferably skin from a protected area, especially from the breast and subjecting the mixtures to strial analysis of gene expression (SAGE) to identify those genes for which expression is markedly different between facial skin and the other tissue. The invention also describes an in vitro method for determining homeostasis of human facial skin; a test kit which comprises a solid support (flexible or rigid) on which are immobilised probes that bind specifically to the factors of interest and a biochip for determining homeostasis of human facial skin. The products of the invention are also used in a method which determines activity of cosmetic and pharmaceutical agents for use against disorders or disturbances of the homeostasis of human skin and a screening method for identification of as many as possible of the genes important for facial skin and thus of a very wide range of potential therespectic and cosmetic agents. Abo31911-Ab035111 represent human DNA Tag fragments used to identify the facial skin-associated genes described in the invention.

This oligonucleotide comprises a sequence that is used to control the rate of translation of a protein in a heterologous organism. The sequence is based on regions of amino acid hydrophobicity in the amino acid sequence of the human 1150RF protein and is adapted for controlling the rate of protein translation in Bombyx mori. The rate controlling the are found downstream of regions encoding transmembrane domains (TMD) and at a distance of 50-85 codons from these regions. The control region increases production and assembly yield of the heterologous protein and improves correct insertion into the membrane. The translation delay imposed by the sequence favours formation of the protein with its native 3-dimensional structure. The control sequence can be used to generate construct for the expression of heterologous proteins especially for use

is useful for stimulating a systemic immune response in a subject against diseases such as cancer, bacterial or viral infection such as acquired immunodeficiency syndrome (AIDS), ransplant tissue rejection or autoimmune disease. The method is also useful for treating or preventing various diseases through the choice of antigen (specific for a condition) and optionally co-administering it. The method is also useful for suppressing growth of a tumour in a subject. The use of sCD40 gene therapy for inducing anti-tumour immune response in vivo instead of native CD40 gene therapy is more efficient as the soluble protein can reach more effector cells than a membrane bound protein. The present sequence encodes for a linker polypeptide used to link sCD40 to GM-CSF to generate a fusion protein in the methods of the present invention
 ö
 histamine, a histamine synthesis inhibitor, and optionally an allergen or isolated nucleic acid molecule that has at least one polynucleotide acquence coding for the allergen, together with a pharmaceutical carrier. The pharmaceutical composition of the invention is useful as a non-specific antiallergic treatment, and also useful in the treatment of allergic hypersensitivity, allergic asthma, allergic rhinitis, and allergic and atopical eczema. This polynucleotide sequence represents an objanucleotide of a DP/DF epitope relating to the antiallergic

Fondon JW;

The invention discloses a method for identifying a candidate polymorphic repeat within a coding sequence (expressed sequence tag, EST), which comprises detecting tandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dataset correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic repeats in correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic marker prediction of ubiquitous simple sequences, PoMPOUS, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic of diseases, predispositions or adverse drug-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis, myotonic dystrophy, hyperandrogeneemia, spinal and bulbar atrophy and spinocereballar ataxia. The sequences presented in ABX79676-ABX80022 are the polymorphic repeats identified for a search of human ESTS

 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

//note="Organ: leaf, Vector: RescueMu (engineered from pBlueScript backbone); Site 1: BamHI; Site_2: BglII;
RescueMu is a 4.9 kb, modified maize Mu transposon
designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription
units: Por more information on RescueMu, go to the web
site 'www.zmdb.iastate.edu' and follow the links for
'RescueMu.' Grid G was grown at Stanford in 2000. DNA was
extracted from leaf punches, double digested using BamHI
and BglII, and ligated to form circular plasmids. DH10B
cells were transformed and then screened on LB plates with
Maize genomic sequences found using engineered RescueMu transposon Unpublished (2001) Contact: Walbot V

Loria E,

Claim 20; Page 13; 32pp; French.

The invention relates to antiallergic compositions containing an antihistamine, a histamine synthesis inhibitor, and optionally an allergen or isolated nucleic acid molecule that has at least one polymolectide sequence coding for the allergen, together with a pharmaceutical carrier. The pharmaceutical composition of the invention is useful as a nonspecific antiallergic treatment, and also useful in the treatment of

AAD14759/c
 ô
 The present invention relates to an antiallergic pharmaceutical composition (1) comprising a pharmaceutical carrier containing an active agent combination of at least two of: an allergen; an antihistamine; and a histamine synthesis inhibitor. (1) is used for treating or preventing allergic hypersensitivity reactions, especially allergic asthma, allergic rhintis or allergic atopic eczema, in babies, children or adults. To illustrate the invention, cysteine protease from Dermatophagoides pteronyssinus (ABB99833), was used as an allergen. The present sequence is a PCR primer, used to illustrate the invention
 Antiallergic composition, useful for preventing and treating e.g. asthma, rhinitis or eczema, containing at least two of allergen, antihistamine and histamine synthesis inhibitor.
allergic hypersensitivity, allergic asthma, allergic rhinitis, and allergic and atopical eczema. This polymucleotide sequence represents an oligonucleotide of a DP/DF epitope relating to the antiallergic compositions of the invention

```
The invention relates to an antisense compound 8 to 30 nucleobases in length targetted to a nucleic acid encoding glycogen synthase kinase 3 alpha. The antisense compound specifically hybridises with and inhibits the expression of glycogen synthase kinase 3 alpha. The antisense compound is useful for the treatment of a diseases associated with glycogen synthase kinase 3 alpha such as diabetes, a neurological disorder. A haematopoietic disorder, a hybroproliferative disorder or a developmental disorder. The antisense compounds may also be used prophylactically to prevent or delay infection, inflammation or tumour formation. The present sequence is a phosphorothicate antisense oligonucleotide targetted to human glycogen synthase kinase 3 alpha DNA

 The specification describes a method of obtaining a modulator of chemokine activity. The method comprises bringing into contact glycoprotein gG, chemokine polypeptides and a test compound, under conditions where gG and chemokine polypeptides bind in the absence of the test compound being an inhibitor, and determining interaction or binding between the gG and chemokine polypeptides. The gG polypeptides, polynucleotides and antibodies are useful for the manufacture of a medicament for treating alphaberpestrus infection or a disorder involving chemokine activity e.g., infectious diseases (malaria, tuberculosis or HIV), inflammatory diseases, psoriasis, atherosclerosis, neoplasia, diabetes, colitis or transplant rejection. PCR primers ACC70267-68 were used to amplify DNA encoding a viral gG. The amplified product was cloned and expressed in a baculovirus system, for use in the

 The present sequence is one of a large number of 5' ESTS derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively total infentified within the present sequence. The 5' ESTS were prepared from total human RNAs or polyA+ RNAS derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design

ANT30871-T30931 represent amplification primers for the coding sequences for the Tetrahymena 80 kD and 95 kD proteins (p80 and p95), respectively (see AAT30867 and AAT30866 for wild type coding sequences). AAT30905-T30931 represent amplification primers for p80. The proteins encoded by the amplified sequences are components of telomerase. The encoded proteins act, when coupled to RNA, to add telomeric repeats (of the sequence TTGGGG) to stabilise chromosomes. The RNA component provides the template for the telomere repeat synthesis. Antibodies against the concoded proteins, can be used as immunoassay reagents for the detection of the proteins. The antibodies can also be used to identify immortalised calls, or predisposition to immortalisation, particularly cancer, or to diagnose a disease caused by a eukaryotic microbe. Inhibitors of the concoded proteins (and the proteins themselves) can be used for therapy or diagnosis. The inhibitors can be used to treat infection by fungi and proteins and seed to reset infection by fungi and proteins are used to produce the recombinant protein, or to isolate sequences are used to produce the recombinant protein, or to isolate similar genes from other organisms, while transformed cells can be used

This DNA encodes a mouse protamine 1. This is used in a method for producing a nucleic acid-bound polypeptide. The method comprises producing a fusion gene containing the polypeptide and a nucleic acid-binding motif, binding a nucleic acid to the polypeptide as a soluble fraction, and purifying the nucleic acid-bound polypeptide from the soluble fraction. When the polypeptide is a recombinant form of an antigen, the nucleic acid-bound polypeptide can be used as an immunoassay reagent for detecting the antigen or an antibody to the antigen, especially in an agglutination assay using particles coated with the nucleic acid-bound polypeptide. The methods can be applied to diagnosis of disease and infection, especially for the detection of HBV and HCV polypeptides. The nucleic acid-bound polypeptides may be immunoreactive in cases where the free polypeptide is not

breeding.
 0
 The invention relates to a novel DNA array giving a representation of a number of Methylococcus capsulatus genes. The method of the invention is useful for determination of the differential expression of the genes of M. capsulatus, and for studying gene expression on a genomic scale and in gene expression assays of M. capsulatus genes. The sequences shown in ABQ90016-ABQ91855 represent M. capsulatus genes for use in arrays of the
 Novel DNA array useful for determining differential expression of Methylococcus capsulatus genes, comprises polynucleotides or oligonucleotides representative for a selective number of Methylococcus capsulatus genes.

The invention relates to a novel DNA array giving a representation of a number of Methylococcus capsulatus genes. The method of the invention is useful for determination of the differential expression of the genes of M. capsulatus, and for studying gene expression on a genomic scale and in gene expression assays of M. capsulatus genes. The sequences shown in ABQ90016-ABQ91855 represent M. capsulatus genes for use in arrays of the

invention

ö

```
The invention describes a substantially purified nucleic acid molecule that encodes a maize, soybean or Arabidopsis thaliana transcription factor or its fragment, where the maize or soybean transcription factor is homeobox, Hilf, leucine Japper, Zinc finger, or other transcription factor along the fragment defined above; a substantially purified maize or soybean transcription factor or its fragment defined above; a substantially purified antibody or its fragment defined above; a substantially binding to the transcription factor or its fragment above; a transformed binding to the transcription factor or its fragment above; a transformed binding to the transcription factor or its fragment above; a transformed containing an oversynessed protein or reduced levels of plant transcription factor; a method of determining an association between a polymorphism and a plant; a method of isolating a nucleic acid molecules, proteins and their fragments are useful for genome mapping, gene identification and analysis, plant breeding, preparation of constructs for use in plant gene expression and transgenic plants. The nucleic acid molecules are useful as markers or probes. This sequence represents a soybean leucine zipper transcription factor polymuclectide.
